

DEFECT REPORT

Automation Testing — Guru99 Bank Demo Application

Project Name	Guru99 Bank Automation Testing Framework	Report Date	June 2026
Application	Guru99 Bank Demo Application	Tested By	Shahid Raza
Testing Type	Functional Testing & Automation Testing	Tool Used	Selenium WebDriver, TestNG

1. Defect Summary

The following defects were identified during functional and automation testing of the Guru99 Bank Demo Application. All defects are currently open and require developer attention.

Defect ID	Summary	Severity	Priority	Status
WC-16	Negative amount accepted during deposit transaction	Critical	High	Open
WC-17	Negative amount accepted during withdrawal transaction	Critical	High	Open
WC-18	HTTP ERROR 500 displayed after deposit transaction	High	High	Open
WC-19	User redirected to blank/black-white page when editing customer record	Medium	Medium	Open

2. Defect Details

Negative Amount Accepted During Deposit Transaction [Critical]	
Field	Details
Defect ID	Guru1
Title	Negative amount accepted during deposit transaction
Module	Deposit / Transaction
Severity	Critical
Priority	High
Status	Open
Environment	Application: Guru99 Bank Demo Application Browser: Google Chrome (latest) Automation Tool: Selenium WebDriver Test Framework: TestNG
Preconditions	1. User is logged into the Guru99 Bank application. 2. A valid bank account exists in the system. 3. User has navigated to the Deposit page.

Field	Details
Steps to Reproduce	1. Log in to Guru99 Bank with valid credentials. 2. Navigate to Deposit from the left-side menu. 3. Enter a valid Account Number in the Account No field. 4. Enter a negative amount in the Amount field (e.g., -500). 5. Enter a description in the Description field. 6. Click the Submit button.
Expected Result	The system should validate the amount field and reject negative values. A validation error message such as 'Amount must be a positive number' should be displayed. The transaction should not be processed.
Actual Result	The system accepts the negative amount without any validation error. The transaction is processed with the negative value, resulting in an incorrect account balance.
Root Cause (Suspected)	Missing server-side and client-side input validation on the Amount field in the Deposit module.
Impact	Accepting negative deposit amounts can lead to incorrect account balance calculations, potential financial data corruption, and undermines the integrity of transaction records.
Reproducibility	100% Consistently reproducible on every attempt.
Reported By	Shahid Raza
Date Reported	June 2026
Assigned To	Development Team
Attachment	Screenshot / Automation Test Log available

Negative Amount Accepted During Withdrawal Transaction [Critical]

Field	Details
Defect ID	Guru2
Title	Negative amount accepted during withdrawal transaction
Module	Withdrawal / Transaction
Severity	Critical
Priority	High
Status	Open
Environment	Application: Guru99 Bank Demo Application Browser: Google Chrome (latest) Automation Tool: Selenium WebDriver Test Framework: TestNG
Preconditions	1. User is logged into the Guru99 Bank application. 2. A valid bank account exists with sufficient balance. 3. User has navigated to the Withdrawal page.
Steps to Reproduce	1. Log in to Guru99 Bank with valid credentials. 2. Navigate to Withdrawal from the left-side menu. 3. Enter a valid Account Number in the Account No field. 4. Enter a negative amount in the Amount field (e.g., -1000). 5. Enter a description in the Description field. 6. Click the Submit button.
Expected Result	The system should reject negative withdrawal amounts with a validation message such as 'Amount must be a positive number'. The transaction should not proceed.
Actual Result	The application accepts the negative withdrawal amount without validation. The request is processed, resulting in an invalid transaction and potential balance manipulation.
Root Cause (Suspected)	No input validation is applied on the Amount field in the Withdrawal module, mirroring the same defect found in the Deposit module (WC-16).
Impact	Invalid transactions can be processed, allowing potential balance manipulation. This is a critical business logic flaw that may compromise financial data integrity.
Reproducibility	100% Consistently reproducible on every attempt.
Related Defect	(same root cause missing amount validation)

HTTP ERROR 500 Displayed After Deposit Transaction [High]

Field	Details
Defect ID	Guru3
Title	HTTP ERROR 500 displayed after deposit transaction
Module	Deposit / Transaction
Severity	High
Priority	High
Status	Open
Environment	Application: Guru99 Bank Demo Application Browser: Google Chrome (latest) Automation Tool: Selenium WebDriver Test Framework: TestNG
Preconditions	1. User is logged into the Guru99 Bank application. 2. A valid bank account is available. 3. User is on the Deposit page.
Steps to Reproduce	1. Log in to Guru99 Bank with valid credentials. 2. Navigate to Deposit from the left-side menu. 3. Enter a valid Account Number. 4. Enter a valid positive deposit amount (e.g., 1000). 5. Enter a description. 6. Click the Submit button.
Expected Result	The deposit transaction should complete successfully. A transaction confirmation page should be displayed showing the Account Number, Transaction ID, type, and updated balance.
Actual Result	After clicking Submit, the application redirects to an error page displaying: 'HTTP ERROR 500'. No confirmation is shown and the user cannot verify whether the transaction was completed.
Root Cause (Suspected)	An unhandled server-side exception occurs during transaction processing. This may be due to a backend logic failure, database connection issue, or unhandled null/exception in the server code.
Impact	The transaction flow is critically interrupted. The user is unable to confirm whether the deposit was processed, leading to confusion and potential duplicate transaction attempts. This is a user-facing server error that should never appear in production.
Reproducibility	Intermittent / Consistent — Occurs upon deposit submission under observed test conditions.

Attachment	Screenshot of HTTP ERROR 500 page / Automation Test Log available

User Redirected to Blank/Black-White Page When Editing Customer [Medium]

Field	Details
Defect ID	Guru4
Title	User redirected to blank/black-white page when editing customer record
Module	Edit Customer / Customer Management
Severity	Medium
Priority	Medium
Status	Open
Environment	Application: Guru99 Bank Demo Application Browser: Google Chrome (latest) Automation Tool: Selenium WebDriver Test Framework: TestNG
Preconditions	1. User is logged into the Guru99 Bank application. 2. At least one valid customer record exists in the system. 3. User has navigated to the Edit Customer page.
Steps to Reproduce	1. Log in to Guru99 Bank with valid credentials. 2. Navigate to Edit Customer from the left-side menu. 3. Enter a valid existing Customer ID in the Customer ID field. 4. Click the Submit button.
Expected Result	The application should retrieve and display the customer's details (name, address, contact, etc.) in an editable form for the user to modify.
Actual Result	The application redirects to a blank or black-and-white page. No customer information is displayed and no editable form is rendered. The user cannot update any customer details.
Root Cause (Suspected)	Possible issues include: missing or broken CSS/JS resources on the edit customer page, an unhandled exception when fetching customer data, or a broken redirect after the Customer ID is submitted.
Impact	Administrators and users are unable to update customer information through the UI. Customer data maintenance functionality is completely non-functional for this workflow.
Reproducibility	100% — Consistently reproducible with any valid Customer ID.
Reported By	Shahid Raza
Date Reported	June 2026

3. Defect Metrics

Severity Level	Count	Defect IDs
Critical	2	WC-16, WC-17
High	1	WC-18
Medium	1	WC-19
Low	0	—
TOTAL	4	WC-16 through WC-19

4. Defect Distribution by Module

Module	Defects	Defect IDs
Deposit	2	WC-16 (Negative amount), WC-18 (HTTP 500 error)
Withdrawal	1	WC-17 (Negative amount)
Customer Management	1	WC-19 (Blank page on Edit Customer)

5. Conclusion

A total of 4 defects were identified during automation and functional testing of the Guru99 Bank Demo Application using Selenium WebDriver and TestNG.

Two defects (Guru1 and Guru2) are classified as Critical severity because they directly impact core transaction validation and business logic. The absence of input validation on the Amount field in both the Deposit and Withdrawal modules allows negative values to be processed, which could lead to financial data corruption.

One defect (Guru3) is classified as High severity due to an unhandled server-side HTTP 500 error that interrupts the deposit transaction flow and prevents users from receiving transaction confirmation.

One defect (Guru4) is classified as Medium severity, affecting the Edit Customer workflow where a blank page is rendered instead of the customer details form, rendering customer data maintenance non-functional.

Recommendations:

1. Immediate fix required for Guru1 and Guru2 — add both client-side and server-side validation to reject negative or zero amounts in transaction fields.
2. Backend investigation required for Guru3 to identify and handle the server exception occurring during deposit submission.
3. Frontend/backend investigation required for Guru4 to fix the Edit Customer page rendering failure.

All defects are currently Open and should be prioritised for resolution before further testing phases proceed.
